

Transforming State Systems to Improve Outcomes for Children with Disabilities

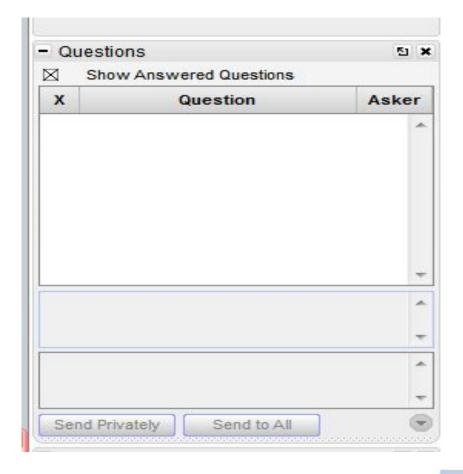

# Tools for Technical Assistance: Building and Measuring Capacity

Rorie Fitzpatrick, Co-Director, NCSI
Kristin Ruedel, Content Specialist, NCSI
Jennifer Pierce, Content Specialist, NCSI
Barbara Sims, Co-Director, SISEP
Noelle Converse, Director, Special Education,
Granite School District

### **Question Box**

 Please direct questions to the question box. A webinar team member will try to assist you as soon as possible.

### Purpose

- Share three tools from the Thought Leader Forum on Building and Measuring Capacity.
  - Additional information on the Forum will be provided in subsequent slides.
  - Link to the tools: http://ncsi.wested.org/resources/tools-publications/
    - Go to bottom of the page to the heading "State Capacity Building."
- Offer suggestions for how these tools may be used by Technical Assistance (TA) Centers, Part B/Part C teams.

### Webinar Overview

- Overview of three tools from the Thought Leader Forum on Building and Measuring Capacity
  - National Center for Systemic Improvement (NCSI)
     Thought Leader Forum: Building and Measuring Capacity
  - Resource List: Tools for Building and Measuring Capacity
  - Practice Brief: Best Practice Recommendations for Building and Measuring Capacity
- Scenarios for use
- Questions

### Session Outcomes

 Develop an understanding of the three tools from the forum and how the tools may be used with Part B and Part C teams.

### **Audience Poll**

- What is your role?
  - Technical assistance provider
  - State, district, or school administrator
  - Teacher or other school staff
  - Other

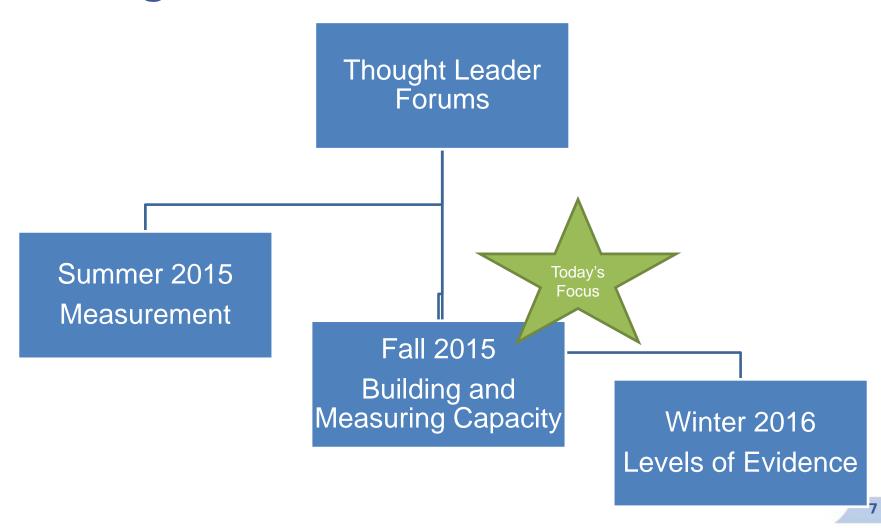

### NCSI Thought Leader Forums

### **Background Information**

## Resources for Thought Leader Forums

- 3. Practice Brief: Best Practice Recommendations for Building and Measuring Capacity

**Dates and Overview** 

#### **Participants**

Transforming State Systems to Improve Outcomes for Children with Disabilities

#### **National Center for Systemic Improvement** (NCSI) Thought Leader Forum: Building and **Measuring Capacity**

#### Overview

The Thought Leader Forum on Building and Measuring Capacity convened in San Francisco, California, on November 12-13, 2015. Participants engaged in a series of small- and whole-group activities to achieve the intended forum outcomes.

#### Forum Participants

Fred Balcom, NCSI

Johnny Collett, NCSI and Council of Chief State School Officers

Noelle Converse, Granite School District James (Jim) E. Coyle, Office of Child

Development and Early Learning Lou Danielson, NCSI

Harriet Dichter, State Capacity Building Center

Bill East, NCSI

Ardith Ferguson, NCSI

Tom Fiore, IDEA Data Center

Rorie Fitzpatrick, NCSI

Lenita Hartman, Colorado Department of Human Services

Lynn Holdheide, NCSI, Center on Great

Teachers and Leaders, and CEEDAR Stephanie Jackson, NCSI and Center on Response to Intervention

Debra Jennings, NCSI

Jennifer Johnson Howell, Utah State Office

of Education

Christina Kasprzak, Early Childhood Technical Assistance Center, DaSy, Frank Porter Graham Child Development Institute

Christy Kavulic, Office of Special Education

Paul Koehler, WestEd

Sheryl Lazarus, National Center on **Educational Outcomes**

Deanne Unruh, National Technical Assistance Center for Transition

Sara Wraight, Midwest Comprehensive

#### Objectives

#### Forum Outcomes

- Develop a shared conceptualization of capacity building to achieve the vision of improved results for infants, toddlers, children, and youth, including those with disabilities.
- 2. Identify the key components for measuring capacity-building efforts.
- 3. Create best practice recommendations to support efforts to build capacity.
- Create best practice recommendations to measure success in capacitybuilding efforts.

Accomplishing Outcomes 1 and 2: Participants first discussed their existing definitions of the term capacity in small groups, using research from Fullan (2005), Massell (1998), and O'Day, Goertz, and Floden (1995) to ground their conversations. Participants then learned about the results from a survey on the key components of building and measuring capacity. This survey, conducted by the Thought Leader Forum planning team to collect advance data from participants, found that forum participants viewed "capacity building" as consisting of at least eight components: (1) leadership, (2) alignment, (3) contextual factors, (4) data-based decision making, (5) stakeholder engagement and communication, (6) technical assistance, (7) vision and goals, and (8) resources.

After learning about the survey results, forum participants divided into small groups to discuss and propose a definition of *capacity building*. Participants were reminded that any proffered definitions of capacity building should help to clarify the components for measuring capacity-building efforts. The forum participants then reconvened as a whole group, sharing small-group work and ultimately determining that capacity building consists of five key components: (1) leadership, (2) alignment, (3) data-based decision making, (4) stakeholder engagement, and (5) readiness. Participants agreed these were the components for measuring capacity-building efforts. Three components identified as central in capacity building in survey findings (i.e., vision and goals, resources, and contextual factors) were incorporated into the other five components. Readiness, however, was a newly identified component of capacity building.

Accomplishing Outcomes 3 and 4: With a shared conceptualization of "building capacity" in mind, participants then returned to their small groups. Each small group adopted one of the five components (e.g., leadership, alignment, stakeholder engagement, data-based decision making, or readiness) and identified best practices to build capacity and to measure capacity-building efforts. A selection of these best practice recommendations is described on the following page.

- Capacity: the ability of a system and the individuals working within it to produce improved outcomes for the infants, toddlers, children, and youth within the system.
  - Individual capacity: knowledge, skills, and disposition
  - Capacity of a system: the degree to which organizational structures and processes support sustained change

## Outcomes: Components of Building and Measuring Capacity

Leadership, Alignment, Data-Based Decision Making, Stakeholder Engagement

#### Forum Outcomes

- Develop a shared conceptualization of capacity building to achieve the vision of improved results for infants, toddlers, children, and youth, including those with disabilities.
- 2. Identify the key components for measuring capacity-building efforts.
- 3. Create best practice recommendations to support efforts to build capacity.
- Create best practice recommendations to measure success in capacitybuilding efforts.

Accomplishing Outcomes 1 and 2: Participants first discussed their existing definitions of the term *capacity* in small groups, using research from Fullan (2005), Massell (1998), and O'Day, Goertz, and Floden (1995) to ground their conversations. Participants then learned about the results from a survey on the key components of building and measuring capacity. This survey, conducted by the Thought Leader Forum planning team to collect advance data from participants, found that forum participants viewed "capacity building" as consisting of at least eight components: (1) leadership, (2) alignment, (3) contextual factors, (4) data-based decision making, (5) stakeholder engagement and communication, (6) technical assistance, (7) vision and goals, and (8) resources.

After learning about the survey results, forum participants divided into small groups to discuss and propose a definition of *capacity building*. Participants were reminded that any proffered definitions of capacity building should help to clarify the components for measuring capacity-building efforts. The forum participants then reconvened as a whole group, sharing small-group work and ultimately determining that capacity building consists of five key components: (1) leadership, (2) alignment, (3) data-based decision making, (4) stakeholder engagement, and (5) readiness. Participants agreed these were the components for measuring capacity-building efforts. Three components identified as central in capacity building in survey findings (i.e., vision and goals, resources, and contextual factors) were incorporated into the other five components. Readiness, however, was a newly identified component of capacity building.

Accomplishing Outcomes 3 and 4: With a shared conceptualization of "building capacity" in mind, participants then returned to their small groups. Each small group adopted one of the five components (e.g., leadership, alignment, stakeholder engagement, data-based decision making, or readiness) and identified best practices to build capacity and to measure capacity-building efforts. A selection of these best practice recommendations is described on the following page.

#### **Outcomes**

**List of Other Tools** 

#### **Best Practices for Building Capacity in Alignment**

- Conduct an analysis of the system, including an inventory of all existing initiatives, resources, personnel, and the skill sets of personnel.
- Create a plan that explicates the vision and path toward a common goal. Ensure
  that plan is housed in a readily accessible, centralized location, and that it is
  widely communicated.
- Align initiatives, resources, and personnel according to the system analysis, reducing potential for the duplication of efforts or competing initiatives.

#### Best Practices for Building Capacity in Leadership

- Create and use an intentional plan for building systemwide supportive and engaged leadership.
- Ensure leaders identify the critical levers to begin systemwide improvement efforts.
- · Encourage the emergence of new leaders.

As forum participants engaged in this work, the group collectively began to reconsider the role of one component—readiness—in capacity building. Participants ultimately concluded that readiness is not a separate component of capacity building. Rather, readiness describes the status of other components (e.g., the degree to which leadership is ready for building and measuring capacity).

The forum conduded with a whole-group discussion of next steps. Collectively, the participants requested that the work from the forum continue so that it could enrich existing efforts among those interested in building and measuring capacity.

#### Forum Next Steps

Two additional documents on building and measuring capacity are now available. Both documents directly incorporate the ideas and work of forum participants. The purpose of these documents is to assist efforts to build and measure capacity in the context of results-driven accountability.

- Resource List: Tools for Building and Measuring Capacity. This document categorizes capacity tools so that teams can determine which ones may be most helpful in their efforts to build and measure capacity.
- Practice Brief: Best Practice Recommendations for Building and Measuring Capacity. This document defines the essential components of capacity building and provides an at-a-glance summary of best practice recommendations for building and measuring capacity.

### **Audience Poll and Questions**

- Who might find this tool helpful to their work?
  - Part B/Part C teams, TA Center staff, or other
- What questions or comments do you have about the tool?

### 2. Resource List

#### Background

Four Components: Capacity Building

Transforming State Systems to Improve Outcomes for Children with Disabilities

#### Resource List: Tools for Building and Measuring Capacity

Capacity refers to the ability of an early intervention/educational system and the individuals working within it to produce improved outcomes for the infants, toddlers, children, and youth within the system. Individual capacity includes a person's existing knowledge, skills, and disposition toward change. Capacity of an early intervention/educational system includes the degree to which organizational structures and processes support sustained change that ultimately leads to improved child/student outcomes.

Many components are important when attempting to build and measure changes in capacity. For example, the coordination of resources, development of infrastructure to support effective professional development, alignment of organizational structures and leadership, and use of instructional practices shown to improve developmental, academic, and behavioral outcomes are all important when building and measuring capacity (Fullan, 2005; Massell, 1998; O'Day, Goertz, & Floden, 1995). Furthermore, several researchers and leading experts in building and measuring capacity agree that at least four components are essential to this work:1

- 1. Stakeholder engagement: The active involvement of a broad range of people in order to problem-solve complex issues and problems
- 2. Data-based decision making: A set of explicit procedures for readily using
- 3. Alignment: The presence of fully linked systems, initiatives, programs, and divisions to achieve a common vision or goal
- 4. Leadership: The supportive and engaged guidance from those in a position of formal or informal authority to achieve a common vision

Myriad tools exist that can be used for building and measuring capacity. These tools are typically geared toward state-level teams and lead agencies, or toward local-level teams. Given the large number of tools that exist, teams may be uncertain which tool is best suited to their needs. The Resource List: Tools for Building and Measuring Capacity categorizes these tools so that teams can determine which ones may be most helpful in their efforts to build and measure capacity.

· The majority of the tools included in this product address the four components of capacity previously identified: stakeholder engagement, databased decision making, alignment, and leadership. One tool (the Multi-Attribute Consensus Building Tool) focuses on one specific component of capacity-stakeholder engagement.

<sup>&</sup>lt;sup>1</sup> For more information about this team of experts, refer to the document National Center for Systemic Improvement (NCSI) Thought Leader Forum: Building and Measuring Capacity.

### 2. Resource List

#### **Directions**

- Note that all of the tools can be used by teams to build capacity and measure capacity.
- Tools on building and measuring capacity have been categorized in two charts
  according to audience. Figure 1 shows tools for Part B state-level teams and
  Part C lead agency teams. Figure 2 shows tools for Part B local-level teams
  and Part C early intervention service teams. Three tools that can be used by
  either type of audience are noted within the figure footnotes.
- The tools have been subcategorized according to one of two purposes: (1) tools used for building and measuring capacity within an overall system, and (2) tools for building and measuring capacity within systems focused on improving outcomes among all young children/students, particularly those with disabilities.

#### The following steps describe the process for locating the most useful tool for building and measuring capacity:

- Identify the audience. Figure 1 shows tools for Part B state-level teams and Part C lead agency teams. Figure 2 shows tools for Part B local-level teams and Part C early intervention service teams.
- Identify the context for use (e.g., overall system or for systems particularly focused on those with disabilities).
- Read the brief description of each tool and pinpoint the one most likely to meet your need.
- 4. Click on the title of the tool to locate it.
- Refer to the Annotated Bibliography section for detailed information about the resource.

### 3. Practice Brief

Background and Definition of Capacity

Four Components of Capacity Building

Transforming State Systems to Improve Outcomes for Children with Disabilities

#### **Practice Brief: Best Practice Recommendations** for Building and Measuring Capacity

Capacity refers to the ability of an early intervention/educational system and the individuals working within it to produce improved outcomes for the infants, toddlers, children, and youth within the system, including those with disabilities. Individual capacity includes a person's existing knowledge, skills, and disposition toward change. Capacity of an early intervention/educational system includes the degree to which organizational structures and processes support sustained change that ultimately leads to improved child/student outcomes.

Many components are important when attempting to build and measure changes in capacity. For example, the coordination of resources, development of infrastructure to support effective professional development, alignment of organizational structures and leadership, and use of instructional practices shown to improve developmental, academic, and behavioral outcomes are all important when building and measuring capacity (Fullan, 2005; Massell, 1998; O'Day, Goertz, & Floden, 1995). The National Center for Systemic Improvement recently convened a Thought Leader Forum to address what is meant by building and measuring state capacity. Researchers, practitioners, and technical assistance providers at the forum agreed that at least four components are essential to this work:1

- 1. Stakeholder engagement: The active involvement of a broad range of people in order to problem-solve complex issues and problems
- 2. Data-based decision making: A set of explicit procedures for readily using data to make decisions
- 3. Alignment: The presence of fully linked systems, initiatives, programs, and divisions to achieve a common vision or goal
- 4. Leadership: The supportive and engaged guidance from those in a position of formal or informal authority to achieve a common vision

This practice brief is designed to define the essential components of capacity and to provide an "at a glance" summary of best practice recommendations for building and measuring capacity. These recommendations are presented in Figure 1. Each diamond within the graphic contains a component of capacity (e.g., stakeholder engagement, data-based decision making, alignment, or leadership) with a brief definition. Best practice recommendations are listed in the box attached to each diamond. These best practices reflect the most important tasks that capacity-builders should undertake when building and measuring capacity. Individuals or teams can use recommendations as they attempt build and measure their capacity to improve

<sup>&</sup>lt;sup>1</sup> For more information about this team of experts, refer to the document National Center for Systemic Improvement (NCSI) Thought Leader Forum: Building and Measuring Capacity.

### 3. Practice Brief

Figure 1. Best Practice Recommendations for Building and Measuring Capacity

#### COMPONENT 1 Stakeholder Engagement

The active involvement of a broad range of people in order to problemsolve complex issues and problems

- · Continuously obtain diverse perspectives across agencies; levels of the system; and cultural and linguistic groups.
- · Establish multi-directional communication structures (e.g., top to bottom and bottom
- · Facilitate involvement by planning times and places when stakeholders are able to participate.
- · Explicitly define and communicate roles and responsibilities.
- · Ensure skilled facilitators manage groups and difficult conversations.
- · Acknowledge and act upon the advice,

#### **COMPONENT 2** Data-Based Decision Making (DBDM)

A set of explicit procedures for readily using data to make decisions

- Create and support a culture of DBDM, ensuring that stakeholders gain technical knowledge to interpret data and use data for decision making.
- . Ensure data related to existing and new initiatives are readily available and examined by a wide group of stakeholders.
- . Shift DBDM interpretation and decisionmaking activities from an expert provider to pract ors in the field.
- Ensure d sed with different stakeholde DBDM

#### COMPONENT 3 Alignment

The presence of fully linked systems, initiatives, programs, and divisions to achieve a common vision or goal

- · Conduct an analysis of the system, including an inventory all existing initiatives, resources, personnel, and the skill sets/competencies of personnel.
- · Align initiatives, resources, and personnel according to system analysis, reducing potential for the duplication of efforts or competing initiatives. Create a plan that explains how alignment helps the systems move toward a common goal.
- . Ensure the plan for alignment is housed in one readily accessible, centralized location, and that it is widely communicated.
- Build strong communication networks across. departments and divisions, and gain support for a common goal.
- Ensure cross-division teams address complex issues related to alignment and that these teams propose viable options to solve issues.

#### **COMPONENT 4** Leadership

- · Create and use an intentional plan for building systemwide, supportive, and engaged leadership.
- Identify critical levers (i.e., entry points) to begin systemwide improvement efforts.
- · Actively voice commitment to improvement efforts and ensure personnel across divisions are able to adjust existing work patterns.
- · Encourage the emergence of new leaders and create opportunities for new and experienced leaders to work together.
- Ensure stakeholders have a voice in improvement efforts.
- Establish and share through oral and written communication the explicit processes for decision making.
- Integrate decision-making processes into organizational routines.
- Measure leadership's growth over time and refine roles and responsibilities to continuously improve.
- · Communicate the "political will" for aligning existing initiatives across departments and divisions, including at the higher levels within in a system.

### 3. Practice Brief

#### Spotlight on Readiness

#### Spotlight: Readiness

This practice brief presents and defines four essential components of building and measuring capacity. To produce outcomes among all infants, toddlers, youth, and children systems, including organizations and the individuals working within those organizations, we must continually consider developing in at least four areas. Systems must refine how they engage stakeholders and use data-based decision making. Continual growth also must be made in how leaders operate within the systems. Divisions and departments must refine their work, becoming more aligned and focused on a vision of improved outcomes for all children.

This brief provides recommendations for best practices in building capacity in stakeholder engagement, data-based decision making, leadership, and alignment. For example, building capacity in stakeholder engagement includes such action as continuously obtaining diverse perspectives across all levels of the system and across different cultural and linguistic groups. Providing regular communication in a multidirectional manner (e.g., top to bottom and bottom to top) is another best practice in building capacity in stakeholder engagement.

Building capacity also is influenced by at least one additional factor: readiness. Readiness can be defined as the presence of clear indicators that demonstrate that individuals and the organization are primed to undertake the changes required to implement new programs and practices. Readiness is important because the presence of it seems to minimize future resistance to change and helps foster a supportive climate for change (Damschroder et al., 2009; Fixsen, Naoom, Blase, Friedman, & Wallace, 2005; Greenhalgh et al., 2004). These researchers suggest that indicators of readiness include the observable presence of the following:

- The commitment and involvement of leaders (e.g., leaders explicitly communicate they are primed to guide others within the system toward the accomplishment of a specific goal)
- The availability of resources such as funding, training, time, and so on (e.g., financial resources are filtered toward activities that help to achieve the common goal)
- The accessibility of clear information about the innovation, program, or practice to be implemented (e.g., summaries of best practices for reading are provided to schools within each district in the state)

With regard to capacity, individuals and the organization will need to clearly demonstrate they are primed for change. However, capacity-builders should avoid waiting for such overt demonstrations of readiness, with the assumption that indicators of readiness will automatically appear. Rather, capacity-builders may need to help individuals and the organization move toward readiness, with the understanding that readiness can be developed over time (Barrett et al., 2013; Fixsen et al., 2013; Glover & DiPerna, 2007). Strategies for supporting readiness are available within several of the tools listed within the accompanying Resource List.

### **Audience Poll and Questions**

- Who might find this tool helpful to their work?
  - Part B/Part C teams, TA Center staff, or other
- What questions or comments do you have about the tool?

### Scenarios

### Scenario 1 and Audience Poll

- A Part B State Team wants to better understand how to build capacity and measure the degree to which their capacity has developed over time. They ask for resources from you.
  - Which tool(s) from the Thought Leader Forum could you share with the state?
